

## BREATH ALCOHOL | REAL-TIME

The newly redesigned BA/RT from Sentinel represents the next generation of compact, hand-held portable breath alcohol (BrAC) monitoring solutions. This innovative and proprietary alcohol testing device provides law enforcement and community corrections agencies with the ability to execute regularly scheduled and on-demand remote alcohol testing of participants at any time—regardless of where the participant may be traveling through the community. Agencies can schedule these random and on-demand tests through SentinelDNA, our intuitive web-based monitoring platform.

BA/RT is equipped with a state-of-the-art, deep-lung fuel cell sensor that provides accurate numeric BrAC results—0.123 for example—that are used by law enforcement agencies nationwide. In addition, BA/RT also comes with these additional powerful built-in features:

- + BA/RT provides agencies with the flexibility to modify the BrAC threshold used at anytime to meet changing local BrAC standards;
- + BA/RT provides a time stamp and precise GPS location of the participant at the time of each test;
- + An LCD display that allows the supervising agency to send one-way text communications to the participant;
- + An acknowledgment button that allows the participant to acknowledge the receipt of text communications/instructions from the supervising agency;
- + Enhanced cellular technology allows for larger coverage areas and even faster delivery of test images and results via state-of-the-art LTE cellular network—no home landline is required;
- + BA/RT now allows participants to initiate a self-test without assistance from the supervising agency;
- + BA/RT features a newly re-designed case that dramatically increases the field of view for its built-in high-resolution camera. BA/RT provides a color photograph of the test subject's face each time a BrAC test is taken;
- + On-board memory can store as many as 1,500 tests in the event of a loss in cellular connectivity. Once BA/RT detects the restoration of cellular connectivity, the unit automatically initiates a call to report stored test results, and;
- + Low-battery notifications are provided by a combination of audible alerts, LED lights and LCD display messages when the device reaches a low battery-life alert threshold.
